Mathematics

Trigonometry

Sum - difference identities

$$\sin(u \pm v) = \sin(u)\cos(v) \pm \cos(u)\sin(v)$$

$$\cos(u \pm v) = \cos(u)\cos(v) \mp \sin(u)\sin(v)$$

$$\tan(u \pm v) = \frac{\tan(u) \pm \tan(v)}{1 \mp \tan(u)\tan(v)}$$

1.1.2 Sum to product identities

$$\cos(u) + \cos(v) = 2\cos(\frac{u+v}{2})\cos(\frac{u-v}{2})$$

$$\cos(u) - \cos(v) = -2\sin(\frac{u+v}{2})\sin(\frac{u-v}{2})$$

$$\sin(u) + \sin(v) = 2\sin(\frac{u+v}{2})\cos(\frac{u-v}{2})$$

$$\sin(u) - \sin(v) = 2\cos(\frac{u+v}{2})\sin(\frac{u-v}{2})$$

1.1.3 Product identities

$$\cos(u)\cos(v) = \frac{1}{2}[\cos(u+v) + \cos(u-v)]$$

$$\sin(u)\sin(v) = -\frac{1}{2}[\cos(u+v) - \cos(u-v)]$$

$$\sin(u)\cos(v) = \frac{1}{2}[\sin(u+v) + \sin(u-v)]$$

1.1.4 Double - triple angle identities

$$\sin(2u) = 2\sin(u)\cos(u)$$

$$\cos(2u) = 2\cos^{2}(u) - 1 = 1 - 2\sin^{2}(u)$$

$$\tan(2u) = \frac{2\tan(u)}{1 - \tan^{2}(u)}$$

$$\sin(3u) = 3\sin(u) - 4\sin^{3}(u)$$

$$\cos(3u) = 4\cos^{3}(u) - 3\cos(u)$$

$$\tan(3u) = \frac{3\tan(u) - \tan^{3}(u)}{1 - 3\tan^{2}(u)}$$

1.2 Sums

$$n^{a} + n^{a+1} + \dots + n^{b} = \frac{n^{b+1} - n^{a}}{n-1}, \ n \neq 1$$

$$1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

$$1^{2} + 2^{2} + 3^{2} + \dots + n^{2} = \frac{n(n+1)(2n+1)}{6}$$

$$1^{3} + 2^{3} + 3^{3} + \dots + n^{3} = \left(\frac{n(n+1)}{2}\right)^{2}$$

$$1^{4} + 2^{4} + 3^{4} + \dots + n^{4} = \frac{n(n+1)(2n+1)(3n^{2} + 3n - 1)}{30}$$

String

Prefix function

2 The prefix function of a string 's' is defined as an array pi of length n, 3 where pi[i] is the length of the longest proper prefix of the substring

```
4 s[0..i] which is also a suffix of this substring.
5 Time complexity: O(|S|).
6 */
vector<int> prefix_function(const string &s) {
      int n = (int) s.length();
      vector<int> pi(n);
      pi[0] = 0;
      for (int i = 1; i < n; ++i) {
12
          int j = pi[i - 1]; // try length pi[i - 1] + 1.
13
          while (j > 0 && s[j] != s[i]) {
              j = pi[j - 1];
          if (s[j] == s[i]) {
              pi[i] = j + 1;
18
          }
      }
      return pi;
21 }
```

Counting occurrences of each prefix

```
vector<int> count_occurrences(const string &s) {
       vector<int> pi = prefix_function(s);
      int n = (int) s.size();
       vector<int> ans(n + 1);
      for (int i = 0; i < n; ++i) {</pre>
           ans[pi[i]]++;
      for (int i = n - 1; i > 0; --i) {
           ans[pi[i - 1]] += ans[i];
      for (int i = 0; i \le n; ++i) {
           ans[i]++;
13
      }
14
      return ans;
15
      // Input: ABACABA
16
      // Output: 4 2 2 1 1 1 1
17 }
```

3.3 Knuth-Morris-Pratt algorithm

```
2 * Searching for a substring in a string.
* Time complexity: O(N + M).
4 */
5 vector<int> KMP(const string &text, const string &pattern) {
      int n = (int) text.length();

4 Number Theory

4.1 Euler's totient function

- Euler's totient function, also known as **phi-function** $\phi(n)$ counts the number of integers between 1 and n inclusive, that are **coprime to** n.
- Properties:
 - Divisor sum property: $\sum_{d|n} \phi(d) = n$.
 - $\phi(n)$ is a **prime number** when n = 3, 4, 6.
 - If *p* is a prime number, then $\phi(p) = p 1$.
 - If *p* is a prime number and *k* ≥ 1, then $\phi(p^k) = p^k p^{k-1}$.
 - If *a* and *b* are **coprime**, then $\phi(ab) = \phi(a) \cdot \phi(b)$.

- In general, for **not coprime** a and b, with d = gcd(a, b) this equation holds: $\phi(ab) = \phi(a) \cdot \phi(b) \cdot \frac{d}{\phi(d)}$.
- With $n = p_1^{k_1} \cdot p_2^{k_2} \cdots p_m^{k_m}$:

$$\phi(n) = \phi(p_1^{k_1}) \cdot \phi(p_2^{k_2}) \cdots \phi(p_m^{k_m})$$
$$= n \cdot \left(1 - \frac{1}{p_1}\right) \cdot \left(1 - \frac{1}{p_2}\right) \cdots \left(1 - \frac{1}{p_m}\right)$$

- Application in Euler's theorem:
 - If gcd(a, M) = 1, then:

$$a^{\phi(M)} \equiv 1 \pmod{M} \Rightarrow a^n \equiv a^{n \mod M} \pmod{M}$$

- In general, for arbitrary a, M and n ≥ $\log_2 M$:

$$a^n \equiv a^{\phi(M) + [n \mod \phi(M)]} \pmod{M}$$

4.2 Mobius function

• For a positive integer $n = p_1^{k_1} \cdot p_2^{k_2} \cdots p_m^{k_m}$:

$$\mu(n) = \begin{cases} 1, & \text{if } n = 1 \\ 0, & \text{if } \exists k_i > 1 \\ (-1)^m & \text{otherwise} \end{cases}$$

- Properties:
 - $-\sum_{d|n}\mu(d)=[n=1].$
 - If *a* and *b* are **coprime**, then $\mu(ab) = \mu(a) \cdot \mu(b)$.
 - Mobius inversion: let *f* and *g* be arithmetic functions:

$$g(n) = \sum_{d|n} f(d) \Leftrightarrow f(n) = \sum_{d|n} \mu\left(\frac{n}{d}\right)g(d)$$

CTU.NegativeZero

Can Tho University Page 7 of 14

4.3 Primes

Approximating the number of primes up to *n*:

n	$\pi(n)$	$\frac{n}{\ln n - 1}$			
$100 (1e^2)$	25	28			
$500 (5e^2)$	95	96			
$1000 (1e^3)$	168	169			
$5000 (5e^3)$	669	665			
$10000 (1e^4)$	1229	1218			
$50000 (5e^4)$	5133	5092			
$100000 (1e^5)$	9592	9512			
$500000 (5e^5)$	41538	41246			
$1000000 (1e^6)$	78498	78030			
$5000000 (5e^6)$	348513	346622			

 $(\pi(n))$ = the number of primes less than or equal to n, $\frac{n}{\ln n - 1}$ is used to approximate $\pi(n)$).

4.4 Wilson's theorem

A positive integer *n* is a prime if and only if:

$$(n-1)! \equiv n-1 \pmod{n}$$

4.5 Zeckendorf's theorem

The Zeckendorf's theorem states that every positive integer *n* can be represented uniquely as a sum of one or more distinct non-consecutive Fibonacci numbers. For example:

$$64 = 55 + 8 + 1$$
$$85 = 55 + 21 + 8 + 1$$

```
vector<int> zeckendoft_theorem(int n) {
      vector < int > fibs = \{1, 1\};
      int sz = 2:
       while (fibs.back() <= n) {</pre>
           fibs.push_back(fibs[sz - 1] + fibs[s - 2]);
           SZ++:
      fibs.pop_back();
      vector<int> nums;
      int p = sz - 1;
      while (n > 0) {
11
12
          if (n >= fibs[p]) {
               nums.push_back(fibs[p]);
13
               n -= fibs[p];
14
          }
15
```

4.6 Bitwise operation

- $\bullet \ a+b=(a\oplus b)+2(a\ \&\ b)$
- $a \mid b = (a \oplus b) + (a \& b)$
- $a \& (b \oplus c) = (a \& b) \oplus (a \& c)$
- a | (b & c) = (a | b) & (a | c)
 a & (b | c) = (a & b) | (a & c)

- $a \mid (a \& b) = a$
- a & (a | b) = a
- $n = 2^k \Leftrightarrow !(n \& (n-1)) = 1$
- $-a = \sim a + 1$
- $(4i) \oplus (4i+1) \oplus (4i+2) \oplus (4i+3) = 0$
- Iterating over all subsets of a set and iterating over all submasks of a mask:

```
for (int mask = 0; mask < (1 << n); ++mask) {
    for (int i = 0; i < n; ++i) {
        if (mask & (1 << i)) {
            // do something...
        }
    }
    // Time complexity: O(n * 2^n).

for (int mask = 0; mask < (1 << n); ++mask) {
    for (int submask = mask; ; submask = (submask - 1) & mask) {
        // do something...
        if (submask == 0) break;
    }
    // Time complexity: O(3^n).
</pre>
```

4.7 Combinatorics

4.7.1 Catalan numbers

$$C_n = \frac{1}{n+1} {2n \choose n} = \frac{(2n)!}{n!(n+1)!}$$

$$C_{n+1} = \sum_{i=0}^n C_i C_{n-i}, C_0 = 1, C_n = \frac{4n-2}{n+1} C_{n-1}$$

• The first 12 Catalan numbers (n = 0, 1, 2, ..., 12):

$$C_n = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786$$

- Applications of Catalan numbers:
 - difference binary search trees with *n* vertices from 1 to *n*.

Can Tho University Page 8 of 14

- rooted binary trees with n + 1 leaves (vertices are not numbered).
- correct bracket sequence of length 2 * n.
- permutation [n] with no 3-term increasing subsequence (i.e. doesn't exist i < j < k for which a[i] < a[j] < a[k]).
- ways a convex polygon of n + 2 sides can split into triangles by connecting vertices.

4.7.2 Stirling numbers of the second kind

Partitions of *n* distinct elements into exactly *k* non-empty groups.

$$S(n,k) = S(n-1,k-1) + kS(n-1,k)$$

$$S(n,1) = S(n,n) = 1$$

$$S(n,k) = \frac{1}{k!} \sum_{i=0}^{k} (-1)^{k-i} \binom{k}{i} i^n$$

4.7.3 Derangements

Permutation of the elements of a set, such that no element appears in its original position (no fixied point). Recursive formulas:

$$D(n) = (n-1)[D(n-1) + D(n-2)] = nD(n-1) + (-1)^n$$

4.8 Pollard's rho algorithm

```
const int PRIME_MAX = (int) 4e4; // for handle numbers <= 1e9.</pre>
2 const int LIMIT = (int) 1e9:
3 vector<int> primes;
5 void linear_sieve(int n);
6 num_type mulmod(num_type a, num_type b, num_type mod);
